

BLOOD PRESSURE CONTROL: WHAT MATTERS? REGISTRIES

WHY

A registry is a list of patient information organized to highlight the care needs for a patient population.

WHAT

Registries can be used to improve the quality of care provided to patients. For example, a provider-led team can use a registry to proactively reach out to patients with diabetes who have not had a foot or eye exam in the past year.

HOW

Electronic health records can often create registries by selecting patient characteristics that are captured in the EHR. Registries can also be created manually by reviewing medical records and creating spreadsheets.
